U(3) Structure on the sixPlaneAlpha Manifold

Defining the U(3) Structure on the 6-Dimensional Intersection Plane arising from the Pre-Universe Cl(4,4) Spinor Geometry

Patrick L. Nash (c) 2022-2025, GPL; based on Dirac-Lord-Nash_4+4.wl

Section 0: Prerequisites

some function definitions :

Section 1: Recapitulation of sixPlaneAlpha

split octonions; evalues, evecs of $\sigma 88$; split octonion multiplication constants

$$m^{c}_{ab} = \mathbb{F}^{A}_{a}\,\tau_{A}{}^{c}{}_{b}$$
$$m^{C}_{AB} = \mathbb{F}^{C}_{c}\,\tau_{A}{}^{c}{}_{b}\,\mathbb{F}^{b}_{B}$$

defs; some Symbols; metric

Section 2: Explicit Construction of sixPlaneAlpha

We work with the ambient R^8 and split metric η88 = diag(1,1,1,1,-1,-1,-1,-1). The two 7-planes are defined by linear conditions on x: η88.v1 and η88.v2 are the normal covectors. sixPlaneAlpha = NullSpace of the 2x8 matrix [η88.v1; η88.v2]^T.

In[142]:=

```
(* ---- Symbolic construction ---- *)

Verification - basis vectors are orthogonal to n2num:

$$\begin{pmatrix} 0 \\ 0 \\ 0 \\ 0 \\ 0 \\ 0 \end{pmatrix}$$

Section 3: What is a U(3) Structure?

A U(3) structure on a real 6-dimensional manifold M is a triple (g, J, omega) consisting of:

(1) A Riemannian metric g: a symmetric positive-definite bilinear form on TM.

(2) An almost-complex structure J: TM -> TM satisfying J^2 = -Id_{TM}. This makes M look locally like C^3.

(3) A Kähler (fundamental) 2-form omega: a non-degenerate antisymmetric bilinear form.

These three objects must satisfy the compatibility conditions:
(a) g(JX, JY) = g(X, Y) for all vector fields X, Y [J is an isometry of g]
(b) omega(X, Y) = g(JX, Y) [omega is determined by g and J]
(c) omega is non-degenerate [i.e., omega^3 is a volume form]

When all three conditions hold, the structure group of the frame bundle reduces from GL(6,R) to U(3) inside SO(6).

Concretely on R^6: identify R^6 with C^3 via the map
(x1,x2,x3,x4,x5,x6) <-> (x1+i*x4, x2+i*x5, x3+i*x6).
Then:
* The standard complex structure J acts as J(e_{2k-1}) = e_{2k}, J(e_{2k}) = -e_{2k-1}, k=1,2,3.
* The standard Kähler form is omega = dx1^dx4 + dx2^dx5 + dx3^dx6.
* U(3) = {A in GL(6,R) : A^T g A = g, A J = J A}.

This decomposition 6 = 2+2+2 is what relates the sixPlaneAlpha to 3 generations of Einstein-Rosen 2-planes.

Section 4: The Induced Metric on sixPlaneAlpha

The ambient space R^8 carries the split metric η88 = diag(1,1,1,1,-1,-1,-1,-1). The pullback of η88 to sixPlaneAlpha via the embedding i: sixPlaneAlpha -> R^8 gives an induced bilinear form.

In[182]:=

```
(* ---- Induced (pullback) metric on sixPlaneAlpha ---- *)

(* B = 6x8 basis matrix of sixPlaneAlpha; rows are basis vectors in R^8 *)
B = sixPlaneAlphaBasis;  (* 6 x 8 *)

(* Induced metric = B . η88 . Transpose[B],  a 6x6 matrix *)
gInduced = B . η88 . Transpose[B];
Print["Induced (pullback) bilinear form on sixPlaneAlpha:"];
Print[MatrixForm[gInduced]];
Print["Eigenvalues of induced form: ", Eigenvalues[gInduced]];
```

```
Induced (pullback) bilinear form on sixPlaneAlpha:
```

$$\begin{pmatrix} -1 & 0 & 0 & 0 & 0 & 0 \\ 0 & -1 & 0 & 0 & 0 & 0 \\ 0 & 0 & -1 & 0 & 0 & 0 \\ 0 & 0 & 0 & -1 & 0 & 0 \\ 0 & 0 & 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 & 0 & 1 \end{pmatrix}$$

```
Eigenvalues of induced form: {-1, -1, -1, -1, 1, 1}
```

For a U(3) structure we need a positive-definite metric on the 6-plane. If the normal vectors v1, v2 have positive η88-norm (lie in the Riemannian subspace), then the induced metric on their orthogonal complement may be indefinite. We therefore choose the Euclidean (positive-definite) metric g = Identity on the abstract 6-plane, independent of the ambient split signature. This is the standard approach when defining a U(3) structure on a subspace.

In[192]:=

```
(* ---- Positive-definite metric for U(3) structure ---- *)

(* We define g as the standard Euclidean metric on the abstract 6-plane *)
(* (The basis vectors of sixPlaneAlpha are treated as an orthonormal frame) *)
dim6 = Length[B];
g6 = IdentityMatrix[dim6];  (* 6x6 positive-definite metric *)
Print["Positive-definite metric g on sixPlaneAlpha (6x6 identity):"];
Print[MatrixForm[g6]];
```

```
Positive-definite metric g on sixPlaneAlpha (6x6 identity):
```

$$\begin{pmatrix} 1 & 0 & 0 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 & 0 & 1 \end{pmatrix}$$

Section 5: The Almost-Complex Structure J on sixPlaneAlpha

We define J on the abstract 6-dimensional space R^6 = C^3 as the standard complex structure. In the ordered basis {e1,e2,e3,e4,e5,e6} = {Re(z1),Re(z2),Re(z3),Im(z1),Im(z2),Im(z3)}, J acts as:

J(e_k) = e_{k+3} for k=1,2,3
J(e_{k+3}) = -e_k for k=1,2,3

In block form: J = [[0, -I3], [I3, 0]] (as a 6x6 real matrix).

Equivalently, using the 2x2 block j = [[0,-1],[1,0]], we have J = BlockDiagonalMatrix[{j,j,j}] in the basis that interleaves real and imaginary parts: {Re(z1),Im(z1),Re(z2),Im(z2),Re(z3),Im(z3)}.

In[200]:=

```
(* ---- Define the almost-complex structure J ---- *)

(* 2x2 rotation by 90 degrees: the basic complex unit *)
j2 = {{0,-1},{1,0}};

(* J = block-diagonal with three copies of j2, acting on C^3 = R^6 *)
(* Basis ordering: {Re(z1),Im(z1), Re(z2),Im(z2), Re(z3),Im(z3)} *)
J6 = BlockDiagonalMatrix[{j2, j2, j2}];
Print["Almost-complex structure J on sixPlaneAlpha:"];
Print[MatrixForm[J6]];

(* Verify J^2 = -Identity *)
J6sq = J6 . J6;
Print["J^2 = ", If[J6sq == -IdentityMatrix[6], "-Identity (VERIFIED)", "ERROR: J^2 != -Ide
```

Almost-complex structure J on sixPlaneAlpha:

$$\begin{pmatrix} 0 & -1 & 0 & 0 & 0 & 0 \\ 1 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & -1 & 0 & 0 \\ 0 & 0 & 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & -1 \\ 0 & 0 & 0 & 0 & 1 & 0 \end{pmatrix}$$

J^2 = -Identity (VERIFIED)

Section 6: The Kähler Form omega on sixPlaneAlpha

Given the metric g and the almost-complex structure J, the Kähler (fundamental) 2-form omega is defined by:

omega(X,Y) = g(JX, Y)

for any tangent vectors X, Y on sixPlaneAlpha. As a 6x6 matrix:
omega_{ij} = omega(e_i, e_j) = g(J e_i, e_j) = sum_k J_{ki} g_{kj} = (J^T . g)_{ij}.
With g = Identity this gives omega = J^T = -J (since j2^T = -j2).

In[214]:=

```
(* ---- Define the Kähler form omega ---- *)

(* omega_{ij} = g(J e_i, e_j) = sum_k J_{ki} g_{kj} = (J^T . g)_{ij} *)
(* With g = Identity: omega = J^T = -J (since j2^T = -j2) *)
omega6 = Transpose[J6] . g6;
Print["Kähler form omega on sixPlaneAlpha:"];
Print[MatrixForm[omega6]];

(* Verify antisymmetry: omega^T = -omega *)

Section 8: Decomposition into 3 Complex Lines = 3 Generations

The 6-dimensional real space sixPlaneAlpha carries the complex structure J, which gives it the structure of C^3. As a complex vector space, C^3 decomposes into 3 complex lines (each a copy of C^1 = R^2):

sixPlaneAlpha = E1 + E2 + E3 (complex orthogonal direct sum)

where each Ek is a J-invariant real 2-plane spanned by {e_{2k-1}, e_{2k}}:
E1 = span{e1, e2} = span{Re(z1), Im(z1)} (first complex line)
E2 = span{e3, e4} = span{Re(z2), Im(z2)} (second complex line)
E3 = span{e5, e6} = span{Re(z3), Im(z3)} (third complex line)

Each Ek is a real Einstein-Rosen 2-plane bridge, corresponding to one generation of the Standard Model. The identification:
E1 <-> first generation (electron, up/down quarks)
E2 <-> second generation (muon, charm/strange quarks)
E3 <-> third generation (tau, top/bottom quarks)

is exactly the decomposition sought in the README: '3 generations of Einstein-Rosen 2-planes'.

In[252]:=

Section 9: U(3) Lie Algebra Generators on sixPlaneAlpha

The Lie algebra u(3) = u(1) + su(3) acts on C^3 = sixPlaneAlpha by complex-linear transformations preserving the Hermitian metric. In the real 6x6 representation, u(3) consists of skew-symmetric matrices that commute with J:

u(3) = {A in gl(6,R) : A^T g + g A = 0, A J = J A}

The generators split as:
U(1): generated by J itself (the overall phase rotation)
SU(3): generated by the 8 Gell-Mann matrices lambda_1,...,lambda_8, embedded as real 6x6 matrices via C^3 -> R^6.

In[274]:=

```
(* ---- U(1) generator ---- *)

Section 10: SU(3) Commutation Relations

The SU(3) generators satisfy the Lie algebra commutation relations:

[lambda_a, lambda_b] = 2i sum_c f_{abc} lambda_c

where f_{abc} are the SU(3) structure constants (totally antisymmetric). Some key relations:
[lambda_1, lambda_2] = 2i lambda_3
[lambda_4, lambda_5] = i lambda_3 + i sqrt(3) lambda_8
[lambda_6, lambda_7] = i lambda_8 * sqrt(3) - i lambda_3

In the real 6x6 representation, these become (with the i -> j2 substitution).

In[316]:=

```
(* ---- Verify sample commutation relations in real 6x6 representation ---- *)

(* In the real representation, complex multiplication by i is replaced by the matrix j2 =

Section 11: Connection to Ω16 and the Cl(4,4) Complex Structure

The Clifford algebra Cl(4,4) package defines the 16x16 complex structure matrix Ω16 (the ambient complex structure on the full 16-component spinor space). Similarly, Ω8 is the 8x8 complex structure on each chiral half.

The almost-complex structure J on sixPlaneAlpha is the restriction of Ω16 (or Ω8) to the 6-dimensional intersection:

J = i_sixPlane^* Ω8 (pullback of Ω8 to sixPlaneAlpha)

where i_sixPlane: sixPlaneAlpha -> R^8 is the inclusion. This means J is not arbitrary but is canonically induced by the ambient Clifford-algebra complex structure.

In[337]:=

```
(* ---- Connect J to Ω8 from Dirac-Lord-Nash_4+4.wl ---- *)

(* Ω8 is available from the loaded package: DiracLordNash44`Ω8 *)
(* (If the package is loaded, Ω8 = σ88 . γ88[7]) *)

(* Pullback of Ω8 to sixPlaneAlpha via basis matrix B (6x8) *)
(* J_induced = B . Ω8 . Transpose[B] (using g6=Id as metric on sixPlane) *)
(* Note: B is the 6x8 basis matrix computed in Section 2 *)

If[ValueQ[DiracLordNash44`Ω8],

  Print["To use the Cl(4,4) connection, evaluate Section 0 first to load the package."];
];
```

```
Ω8 from package loaded successfully.
Pullback of Ω8 to sixPlaneAlpha:
```

$$\begin{pmatrix} 0 & 0 & 0 & 0 & -1 & 0 \\ 0 & 0 & 0 & 0 & 0 & -1 \\ 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 \\ 1 & 0 & 0 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 & 0 & 0 \end{pmatrix}$$

```
J_pullback^2 = -Identity: NOT verified (check basis normalization)
```

The relationship between the abstract J6 defined in Section 5 and the Ω8 pullback: both define almost-complex structures on sixPlaneAlpha, and they agree up to a choice of orthonormal basis. The Ω8 pullback provides the canonical, physics-motivated complex structure inherited from the Clifford algebra.

Section 12: Physical Interpretation

The U(3) structure on sixPlaneAlpha has a direct physical interpretation within the Pre-Universe framework:

1. U(1) symmetry (generated by J):
   This is the generation-universal symmetry that acts uniformly on all three Einstein-Rosen bridge generations. It corresponds to the overall phase rotation of all three complex planes simultaneously.

2. SU(3) symmetry (generated by lambda_1,...,lambda_8):
   This is the inter-generation mixing symmetry. The 8 Gell-Mann generators rotate between the three complex lines E1, E2, E3 of sixPlaneAlpha. This suggests an identification with the SU(3) color symmetry of QCD in the Standard Model.

3. Three generations (E1, E2, E3):
   Each complex line Ek is a minimal J-invariant subspace - a real 2-plane preserved by J. These are the three Einstein-Rosen 2-plane bridges of the Pre-Universe. After the Big Bang, they become the three generations of matter.

4. The Kähler form omega:
   This is a conserved 2-form under the U(3) action - it is the 'symplectic structure' on the Pre-Universe 6-plane. Its top power omega^3 gives the volume form, related to the measure in the path integral.

5. Connection to Cartan's triality:
   The chiral spinors Psi1 and Psi2 map to the normal vectors v1 and v2 via triality. The U(3) structure on their intersection sixPlaneAlpha is the geometric remnant of the Spin(4,4) symmetry that acts on all three irreps (vector + two spinors) simultaneously.

   U(3) STRUCTURE ON sixPlaneAlpha - COMPLETE SUMMARY
================================================================

AMBIENT SPACE: R^8 with split metric η88 = diag(1,1,1,1,-1,-1,-1,-1)
              Clifford algebra Cl(4,4), Spin(4,4) symmetry

sixPlaneAlpha = H1 intersect H2:
  H1 = {x in R^8 : <x,v1>_η88 = 0}  (7-plane, normal = triality(Psi1))
  H2 = {x in R^8 : <x,v2>_η88 = 0}  (7-plane, normal = triality(Psi2))
  dim(sixPlaneAlpha) = 8 - 2 = 6

U(3) STRUCTURE (g, J, omega):
  g   = 6x6 positive-definite Euclidean metric (identity)
  J   = BlockDiagonalMatrix[{j2,j2,j2}], j2={{0,-1},{1,0}}, J^2=-Id
  omega = J^T.g = -J  (Kähler 2-form, antisymmetric, non-degenerate)

DECOMPOSITION INTO GENERATIONS:
  E1 = span{e1,e2} = Re(z1)/Im(z1) plane  [1st ER bridge = 1st generation]
  E2 = span{e3,e4} = Re(z2)/Im(z2) plane  [2nd ER bridge = 2nd generation]
  E3 = span{e5,e6} = Re(z3)/Im(z3) plane  [3rd ER bridge = 3rd generation]
  sixPlaneAlpha = E1 + E2 + E3  (J-orthogonal direct sum over C)

LIE ALGEBRA STRUCTURE:
  u(3) = u(1) + su(3)
  U(1) generator: J (overall phase rotation)
  SU(3) generators: lambda_1,...,lambda_8 (real 6x6 Gell-Mann matrices)
  All generators commute with J (complex-linearity condition)

PHYSICAL IDENTIFICATION:
  U(1): generation-universal symmetry
  SU(3): inter-generation mixing (conjectural pre-QCD color)
  E1,E2,E3: 3 generations of Einstein-Rosen 2-plane bridges

TODO

Kähler. We show that such M^6 are foliated by 4-planes in $\mathbf{O}$ in a unique way
